Introduction

The **Contamination criticality** is nowadays recognized by the space community. Throughout the years, many efforts have been directed to understanding and identifying **Outgassing sources**.

However, there is still a general knowledge deficiency related to the **effects** of the presence of such contamination on different optical surfaces.

Main Goals

- The direct determination of the effects of the contaminant film growth: the spectral response.
- **Substrate effect** on the film formation (e.g. island vs uniform layer).
- The verification of any mission's contamination budget in respect to the optics performance.
- The **optical characterization of the contamination** layer (by using thin-film techniques to model the obtained data).
- A **database** containing the optical properties of the contamination species. This will enable the estimation of contamination effects on other surfaces.
- **Environmental** effects (pressure, temperature, (V)UV irradiation).

Test Method and Chamber

The **new test method** was designed to evaluate *in-situ* the performance of optical surfaces **during** the **deposition** of a **contamination layer**.

Evaluation of contamination's **direct consequences/effects** on sensitive surfaces.

Test Method and Chamber

*

RTV S691: SiO2 In-situ results

- Main absorption peak: < 240 nm
- Second absorption peak: 270 nm
- Thickness increase = transmittance decrease
- There are small interferometer fringes noticeable from a thickness of 85 nm.

2017 CCMPP – NASA's Goddard Space Flight Center

B. Bras, Y. Tsuchiya, R. Rampini, C. Semprimoschnig | 20/07/2017 | Slide 13

RTV S691: Comparison to JAXA results

Contaminant Thickness: 0nm

• Offset of approximately 1% over the whole wavelength range.

Closing Remarks

- Closer to **understanding** the effects of contamination on the overall performance of the subsystem.
- Mission's contamination budget **verification**.
- **Affinity** substrate/contamination.
- **Environmental** effects (pressure, temperature, (V)UV irradiation).
- Database.
